Explanation for the high level of nitrogen is an extended period of no aeration due to blower failure. The VSD went out on thermal overload ( Blower No 1 ) with cooling fan failure. The SCADA would not call for either one of the other blowers to cut in. We were manually aerating whilst in normal attendance at the plant during the day but the system would again fail between cycles during the evening. Upon initial detection, all decanted effluent was diverted to pond B in order to be pumped back to the inlet works for a second treatment process. Initially, prior to discovering the fault, a large volume of effluent exposed to no aeration would have made it into pond A thus contaminating the existing treated effluent. This occurred over the Christmas break and technical staff were not able to attend. The problem was traced back to SCADA programming and resolved by Ben Forestal from Safegroup. The VSD from Blower 1 has been sent back to the manufacturer as damage occurred to the printed circuit board prior to the activation of overtemperature protection.

Iluka Monitoring Point 2 - Ebb-tide release

Biochemical ox Total suspencNitrogen (tot:Ammonia Oil and grease Phosphorus ( Faecal coliforms
